

## A Geometric Exploration

By [At Right Angles](#) | Aug 9, 2019

A question about angle bisectors Consider a  $\triangle ABC$  in which D, E and F are the midpoints of the sides BC, CA and AB respectively. Let G be the centroid of triangle ABC, i.e., the point of intersection of the medians AD, BE and CF. It is well-known that G is also the centroid of triangle DEF. If, instead of being the midpoints, the points D, E and F are the points of intersection of the internal bisectors of
